CASE STUDY: DIGITAL HUB & INFORMATION ARCHITECTURE (IO.UNY.AC.ID)

Role:	Web Developer & Digital Communication Lead
Platform/CMS:	Drupal 7 CMS
Frontend:	Custom HTML/CSS with Bootstrap Architecture
Live URL:	https://io.uny.ac.id

1. Project Overview

The International Office (IO) UNY website serves as the primary digital gateway for the university's global footprint. The project goal was to completely overhaul the visitor experience by transforming a traditional, cluttered university page into a modern, highly navigable digital hub. Built on top of the robust Drupal CMS, the site empowers non-technical staff to easily manage announcements, events, and programs while ensuring a seamless journey for visitors.

2. Key Engineering & UX Challenges

A. Information Architecture & The "Pathway-First" UX Strategy

The Challenge: The International Office serves four vastly different user demographics: prospective international students, current international students, local UNY students seeking to study abroad, and global institutional partners. Previously, information was mixed, causing high bounce rates and confusion.

The Solution: I architected a "Pathway-First" User Experience. The moment a visitor lands on the homepage, they are visually split into 4 distinct pathways based on their persona. This strategic funneling instantly reduces cognitive load, allowing users to navigate directly to highly specific information—such as BIPA language classes, KNB Scholarships, or Visiting Professor arrangements—without getting lost.

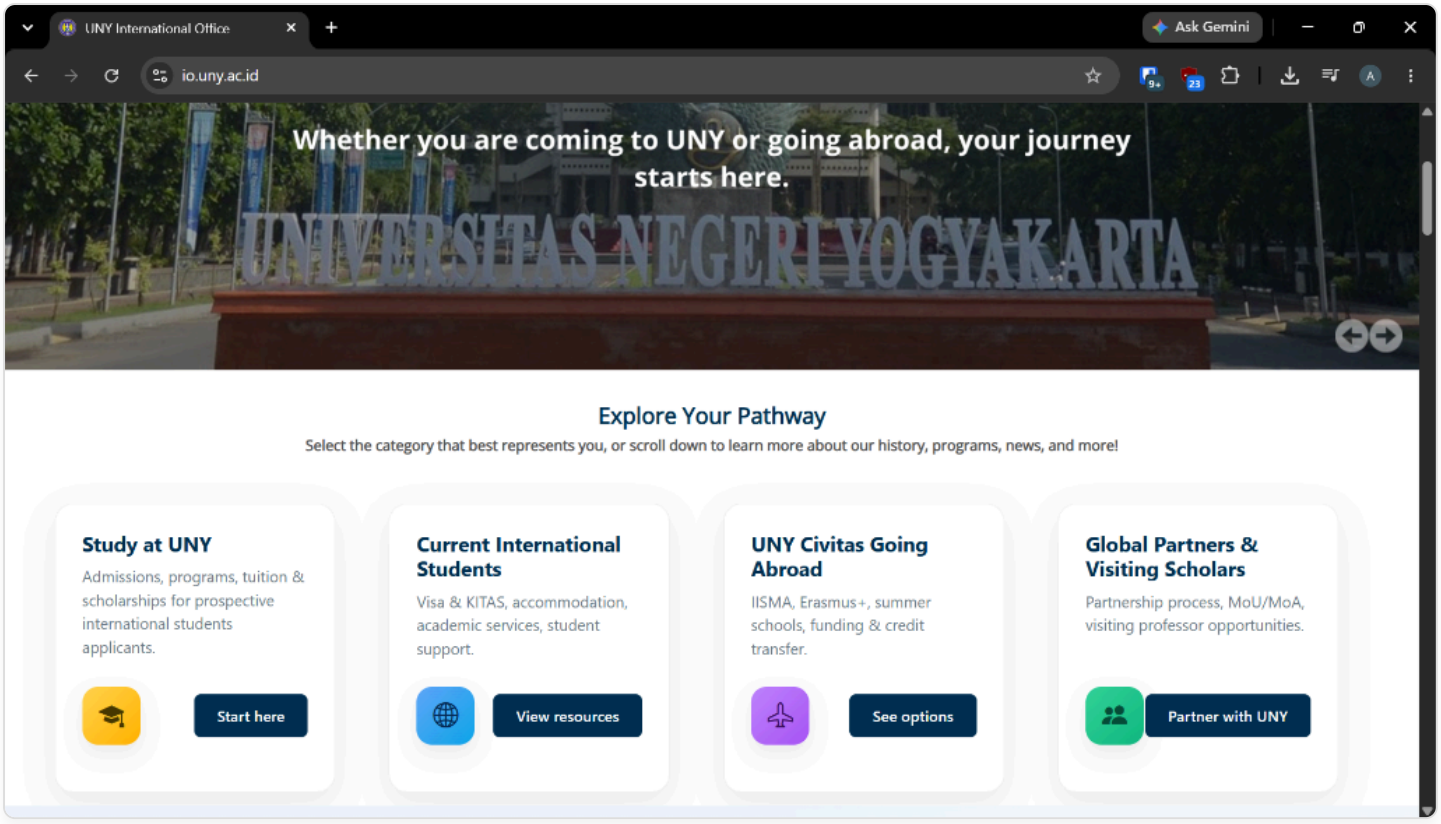

B. Scalable Content Management

The Challenge: The International Office frequently publishes news, scholarship deadlines, and global events. Hard-coding pages or relying heavily on IT intervention for minor updates was highly inefficient.

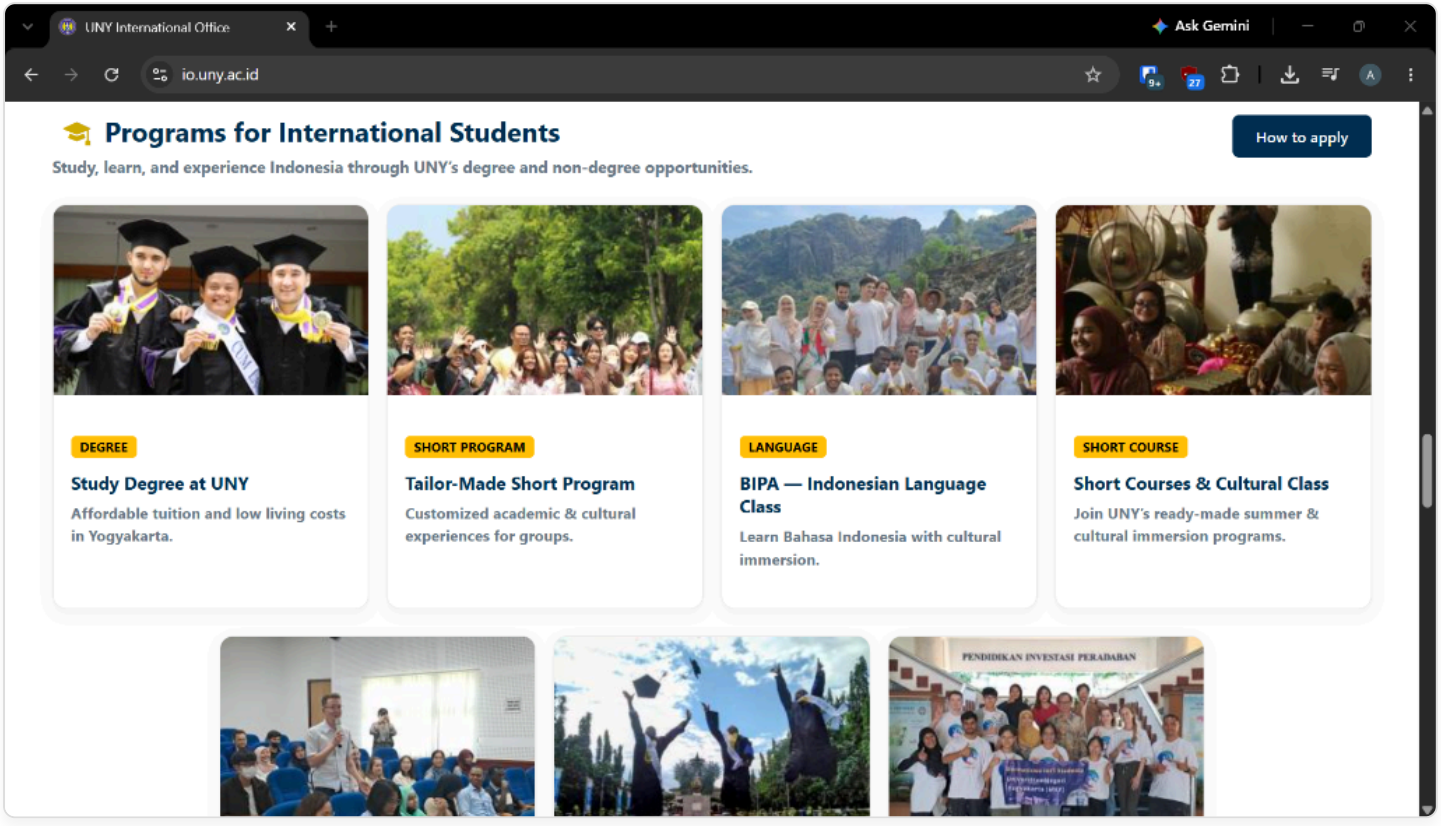

The Solution: I utilized Drupal CMS to build a highly scalable content architecture. By configuring custom content types, views, and taxonomy systems within Drupal, I enabled the administrative staff to seamlessly update the "Global Standing," "News," and "Programs" sections independently. The frontend was styled with

custom CSS and modern UI libraries (Bootstrap Icons) to maintain a polished, enterprise-grade aesthetic regardless of the content inputted by staff.

3. System Interface & UX Walkthrough

The Pathway-First Architecture: Funneling 4 distinct user demographics immediately upon landing.

Programs Showcase: Dynamic content grids managed seamlessly via Drupal CMS.
